User
Management
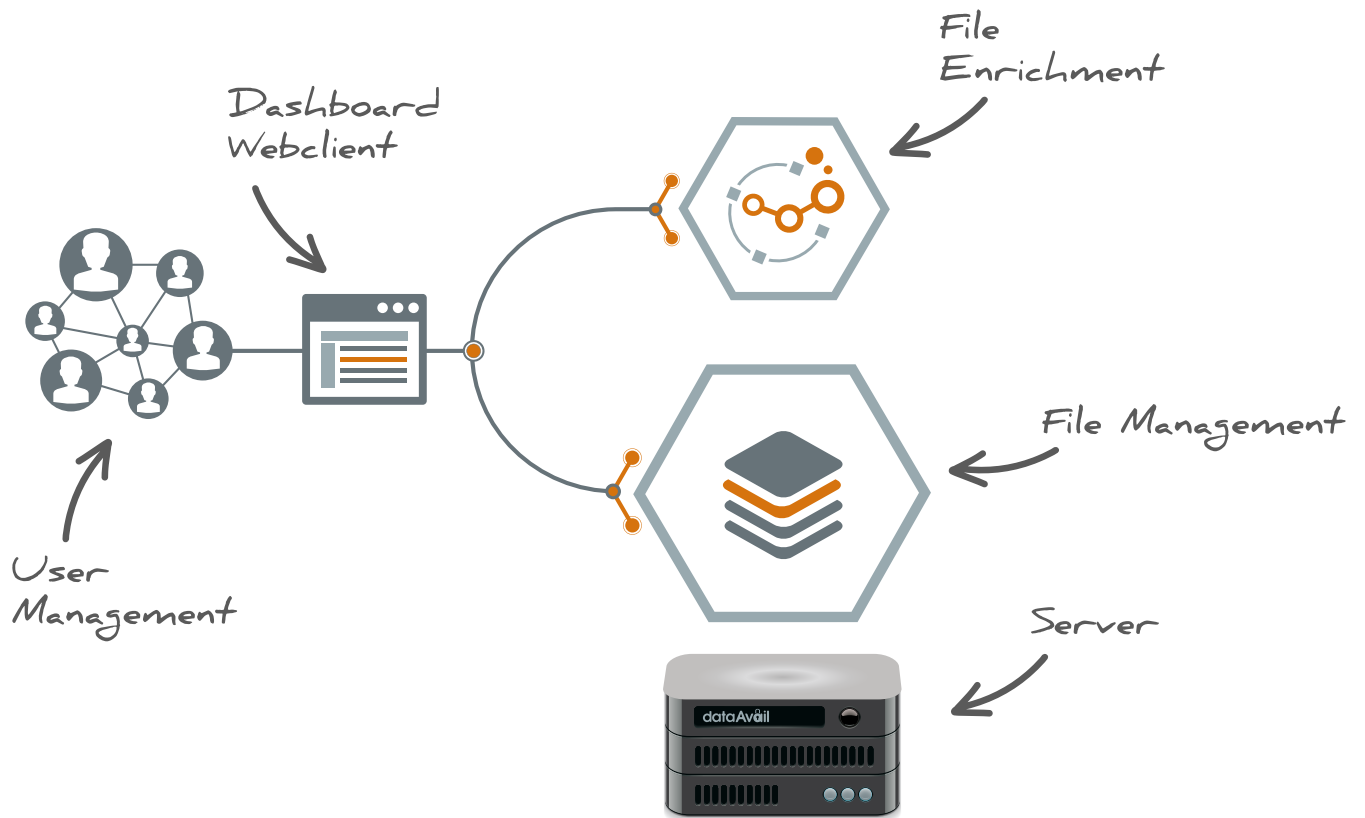

Powerful like FTP

The basis of dataAvail
is a powerful and reliable
file storage, which is
independent of
the administrative level
- in a secured area.

Enterprise Features

dataAvail offers extensive
possibilities to enrich every
single file with information.
For example the most
flexible file versioning,
which is currently available
on the market.

Simple like an App

The handling of dataAvail is
simple and user friendly.
The initial training costs for
the system are minimal.

Cost Optimization

dataAvail is the long-
sought alternative to
self-developed workflow
structures, which are
often more expensive than
necessary - in maintenance
and preservation.

File Management

dataAvail is a **file management & file sharing solution** that enables the exchange of files of any kind via a web interface - easy to use, secure and with sophisticated features. **Designed as an independent, secure and user-friendly solution, dataAvail is particularly suitable for planning, archiving and process development.**

In the development of dataAvail, we considered especially complex teams and client structures, which can be mapped with different authorizations and interaction possibilities.

The Administration

provides the ease of use needed in project data management to ensure secure file management for teams, enabling collaboration and on-the-go productivity: a single interface to access, synchronize and share files - while (team) management can manage, control, audit and communicate. **Customers can be involved at any level of collaboration and approval.**

Every form of interaction is clearly and reliably documented and remains assignable to the responsible users, even if they lost their user privileges. Unlimited sortable lists allow a g**apless project data documentation** at any time.

The Special Thing

about Dataavail is the file enrichment. dataAvail offers a file meta Layer, which allows an enrichment of the data. **Sophisticated versioning** replaces the error-prone and communication intensive **naming of the respective version of data:** both customers and employees always see the latest version, but can access older versions at any time if desired. The system offers several features, e.g. anonymous

sharing for external users with password protection and link expiry. Comments - also on individual older versions, temporary file locks and extensively configurable e-mail notifications facilitate implementation in existing workflows and **ensure smooth collaboration even with huge, heterogeneous teams and clients.**
Security & Sovereignty of data

Especially in countries with clear and strict data protection guidelines and for **public clients,** the implementation of dataAvail shows its full potential: While cloud services store confidential data on external servers abroad and violate company policies and government regulations, dataAvail s**tores data in a country and server of**

your choice. Hosting with access control, which is subject to European law, ensures that dataAvail customers **are always in control of their sensitive data and that the question of data protection violations does not arise.** dataAvail meets all requirements of the European general data protection regulation (GDPR).

Common problems

Working with dataAvail

Where's the release?

In which version did the error occur?

Which version was downloaded?

How many versions until approval?

CEO/Data Management

dataAvail enables the management to view all activities in the desired detail view and to distribute relevant project data to customers. With the available tools, also individual workflows can be implemented, such as internal version releases.

dataAvail replaces any form of self-developed file server solutions with a much more secure, powerful and already medium-term cheaper system.

Did the client receive the correct version?

In which version did the error occur?

Who documented the customer release?

How do I document all processes since the beginning?

Projectmanagement

dataAvail supports the complete clarity and traceability of processes with filterable logs, which can also be used for **gapless and detailed documentation** upon project completion.

The comment function, implemented in several places, allows fluid team communication; the multi-level user administration allows even complicated team structures to be displayed. All actions of each individual user are logged and stored for the entire lifetime of the system, even if the user lost their privileges.

Do I work with the latest version?

Who changed files at what time?

What happened during my absence?

Did the client receive the correct version?

Team

dataAvail enables the management of project data with **version security** and a essential enrichment with functions and information that takes teamwork to a new level.

Even teams, which are scattered across the globe (contractor / client) benefit from stringent workflow that makes otherwise undocumented processes visible. The data management itself communicates transparently and simultaneously with all participants through this meta information.

Up-to-date, secure and sophisticated data-management-system - made in Europe. Hosted in Europe.

We offer a convenient solution
for your data management and data sharing.

dataAvail meets all requirements
of the european data protection regulation.

Hosted in Austria, certified secured data centers,
customized security concept.

Adjustable user and group management, fully scalable
system, extensive log files and reporting,
customized modules and process mapping.

Even in its basic configuration, dataavail offers so much functionality and process simplification
that it provides a clear cost advantage compared to conventional systems, particulary with regard
to teams 100+.

Reference projects

Viennese government relies on dataAvail regarding the complete file management process for the
metro construction U2-U5, including all certification processes.
Stadt Wien - project Stadtstrasse, data management
IG-PREM - project-oriented, scalable platform für data management
